Assignment 21.5

Name: P. Vishwateja

Batch: 44

H. No: 2303A52389

Task A – AI-Based Initial Program Development

Prompt:

Generate a Python program for a Student Grade Calculator that takes marks of 3 subjects as input and calculates the average and grade.

Then enhance the program by adding:

- Input validation (marks between 0–100)
- Exception handling for invalid inputs
- Correct average calculation
- Total marks display
- Pass/Fail status based on individual subject marks
- User-friendly output

Code:

assgn21.5 task1.py > ...

```python
#AI-Based Initial Program Development
#Use AI to generate a basic program (e.g., Student Grade Calculator).
#Ask AI to enhance it with validation and additional features.
#Compare both versions.

#Basic program
m1 = int(input("Enter marks of subject 1: "))
m2 = int(input("Enter marks of subject 2: "))
m3 = int(input("Enter marks of subject 3: "))

avg = (m1 + m2 + m3) / 3

print("Average:", avg)

if avg >= 90:
    print("Grade: A")
elif avg >= 75:
    print("Grade: B")
elif avg >= 50:
    print("Grade: C")
else:
    print("Grade: Fail")

#Enhanced program with validation
def get_marks(subject):
    while True:
        try:
            marks = int(input(f"Enter marks for {subject}: "))
            if 0 <= marks <= 100:
                return marks
            else:
                print("Marks should be between 0 and 100!")
        except:
            print("Invalid input! Please enter a number.")

```

You have Docker installed on your system. Do yo
install the recommended extensions from Micros
Install

Observation:

The initial AI program was simple and worked only for valid inputs but lacked validation and error handling. After refining the prompt, the improved version became more reliable, user-friendly, and included real-world features. This shows that better prompts lead to better AI-generated code.

Task B – AI-Assisted Application Improvement

Prompt:

Generate a simple Python program for a Library Management system to add and display books.

Then enhance the program by adding:

- Search functionality
- Book issue and return system
- Input validation
- Better structured code using functions

Code:

assgn21.5 task2.py > ...

```python
# AI-Assisted Application Improvement
#Generate a simple program (e.g., Library Management).
#Use AI to add new functionalities.
#Analyze improvements in structure and performance.

#Basic
books = []

n = int(input("Enter number of books: "))

for i in range(n):
    name = input("Enter book name: ")
    books.append(name)

print("\nBooks in Library:")
for b in books:
    print(b)

#Enhanced with AI
books = []
issued = []

def add_book():
    name = input("Enter book name: ")
    books.append(name)
    print("Book added!")

def display_books():
    print("\nAvailable Books:")
    for b in books:
        if b not in issued:
            print(b)

def search_book():
    name = input("Enter book to search: ")
```

PROBLEMS OUTPUT DEBUG CONSOLE TERMINAL PORTS

    if ch == 1:
        add_book()
    elif ch == 2:
        display_books()
    elif ch == 3:
        search_book()
    elif ch == 4:
        issue_book()
    elif ch == 5:
        return_book()
    elif ch == 6:
        break
    else:
        print("Invalid choice!")
```

PROBLEMS OUTPUT DEBUG CONSOLE TERMINAL PORTS

```
PS C:\Myfiles\Attachments\Desktop\Ai-Assist> & C:/Users/sushm/AppData/Local/Programs/Python/Python312/python.exe "c
Enter book name: efd
Book added!

1.Add 2.Display 3.Search 4.Issue 5.Return 6.Exit
Enter choice: 4
Enter book to issue: fds
Book not available!
```

Observation:

- Basic program was simple and limited
- Enhanced version added search, issue, return features
- Code structure improved using functions
- Program became more interactive and user-friendly
- Shows that AI can improve both functionality and structure

Task C – Git Workflow Practice

Prompt:

Generate a clear and concise Git commit message for the following changes:

- Added search functionality

- Implemented input validation

- Improved code structure using functions

Code:

assgn21.5 task3.py > ...

```python
#AI for Commit Message Writing
# Perform multiple code changes.
# Use AI to generate commit messages.
# Compare with manually written messages.

#basic
books = []

name = input("Enter book name: ")
books.append(name)

print(books)

#Enhanced with AI
books = []

def add_book():
    name = input("Enter book name: ")
    if name != "":
        books.append(name)
        print("Book added!")

def search_book():
    name = input("Enter book to search: ")
    if name in books:
        print("Found")
    else:
        print("Not Found")

add_book()
search_book()
```

PROBLEMS OUTPUT DEBUG CONSOLE TERMINAL PORTS

```
.py"'
PS C:\Myfiles\Attachments\Desktop\Ai-Assist> & C:/Users/sushm/AppData/Local/Programs/Python/Python312/python.exe
Enter book name: abc
['abc']
Enter book name: sdd
Book added!
Enter book to search: abc
Not Found
PS C:\Myfiles\Attachments\Desktop\Ai-Assist>
```

Observation:

AI-generated commit messages are more clear, specific, and structured compared to manually written messages. They describe the exact changes made in the code, which improves readability and project tracking. Manual messages are quicker to write but may be vague or inconsistent. This shows that AI helps in generating better quality commit messages and saves time.

Task D – Pair Programming with AI Assistance

Prompt:

Improve the given Python library management code by adding:

- Input validation
- Search functionality
- Issue and return system
- Better structure using functions
- User-friendly interaction

Code:

assgn21.5 task4.py > ...

```python
#Pair Programming with AI Assistance
# Student A develops initial code.
# Student B uses AI to enhance and optimize.
# Integrate changes using Git.

#basic
books = []

n = int(input("Enter number of books: "))

for i in range(n):
    name = input("Enter book name: ")
    books.append(name)

print("Books:", books)

books = []
issued = []

def add_book():
    name = input("Enter book name: ")
    if name != "":
        books.append(name)
        print("Book added!")

def display_books():
    print("\nAvailable Books:")
    for b in books:
        if b not in issued:
            print(b)

def search_book():
    name = input("Enter book to search: ")
    if name in books:
```

install the recommended extensions from Mic
Install

Observation:

Pair programming with AI improved both code quality and development speed. Student A created a basic version, while Student B used AI to enhance it with better features and structure. The final program became more efficient, user-friendly, and maintainable. Git helped in managing and merging contributions smoothly without affecting the original code.

Task E – Collaborative Development using Branches

Prompt:

Generate Python functions for a library system including:

- Search book feature
- Issue and return book functionality
- Input validation
- Menu-driven interaction

Code:

assgn21.5 task5.py > ...

```python
#Collaborative Development using Branches
# Divide work between two students.
# Use AI for feature implementation.
# Merge contributions into a single project

#basic
books = []

def add_book():
    name = input("Enter book name: ")
    books.append(name)

def display_books():
    print("Books:", books)

issued = []

def search_book():
    name = input("Enter book: ")
    if name in books:
        print("Found")
    else:
        print("Not Found")
```

Not Committed Yet

Observation:

Collaborative development using branches allows multiple students to work independently without conflicts. Student A created the base structure, while Student B added AI-based features in a separate branch. After merging, the final project combined all functionalities efficiently. This approach improves teamwork, code organization, and development speed.
